Abstract

In this paper, based on our previous researches about generalized modus ponens with linguistic modifiers for If … Then rules, we propose generalized If…Then…Else inference rules with linguistic modifiers in linguistic many–valued logic framework with using hedge moving rules for approximate reasoning.

Keywords: Hedge algebra, linguistic truth value domain, generalized If…Then…Else inference rules, linguistic many–valued logic, approximate reasoning.

1. Introduction

Information science has brought about an effective tool to help people engaged in computing and reasoning based on natural language. The question is how to model the information processing of human? A method of computation with words (CWW) has been studied by Zadeh [1,2], with the construction of the fuzzy set representing the concept of language and the reasoning based on the membership function. In [3] N. C. Ho, Wechler, W. proposed hedge algebraic structures in order to model the linguistic truth value domain. Based on the hedge algebraic (HA) structures, N.C. Ho et al [4] gave a method of linguistic reasoning, but also posed further problems to solve.

In [9,10] are generalized If…Then…Else inference rules for approximate reasoning with fuzzy conditional proposition based on membership function of fuzzy sets.

In this paper, following our previous works, we are studying generalized If…Then…Else inference rules with linguistic modifiers in linguistic many–valued logic, with using hedge moving rules and hedge inverse mapping to solve the problem of reasoning.

2. Preliminaries

In this session, we would present some concepts, properties of the monotonous hedge algebra, hedge inverse mapping that have been researched in [3-5,8-10].

2.1 Monotonous hedge algebra

Consider a truth domain consisting of linguistic values, e.g., VeryVeryTrue, PossiblyMoreFalse; etc. In such a truth domain the value VeryVeryTrue is obtained by applying the modifier Very twice to the generator True. Thus, given a set of generators \( G = (\text{True}; \text{False}) \) and a nonempty finite set \( H \) of hedges, the set \( X \) of linguistic values is \( \{\delta c \mid c \in G, \delta \in H^*\} \).

Furthermore, if we consider \( \text{True} > \text{False} \), then this order relation also holds for other pairs, e.g., \( \text{VeryTrue} > \text{MoreTrue} \). It means that there exists a partial order \( > \) on \( X \).

In general, given nonempty finite sets \( G \) and \( H \) of generators and hedges resp., the set of values generated from \( G \) and \( H \) is defined as \( X = \{\delta c \mid c \in G, \delta \in H^*\} \).

Given a strictly partial order \( > \) on \( X \), we define \( u \geq v \) if \( u > v \) or \( u = v \). Thus, \( X \) is described by an abstract algebra \( HA = (X, G, H, >) \).

Each hedge \( h \in H \) can be regarded as a unary function \( h: X \rightarrow X; x \mapsto hx \). Moreover, suppose that each hedge is an ordering operation, i.e., \( \forall h \in H, \forall x \in X; hx > x \text{ or } hx < x \).

Let \( I \in H \) be the identity hedge, i.e., \( Ix = x \) for all \( x \in X \). Let us define some properties of hedges in the following definition.

Definition 1 A hedge chain \( \sigma \) is a word over \( H, \sigma \in H^* \). In the hedge chain \( h_\sigma \ldots h_1 \), \( h_1 \) is called the first hedge whereas \( h_\sigma \) is called the last one. Given two hedges \( h, k \), we say that:

i) \( h \) and \( k \) are converse if \( \forall x \in X; hx > x \text{ if and only if } kx < x \);
ii) \( h \) and \( k \) are compatible if \( \forall x \in X; hx > x \text{ if } kx > x \);
iii) \( h \) modifies terms stronger or equal than \( k \), denoted by \( h \geq k \), if \( \forall x \in X; (hx > kx \leq x) \text{ or } (hx \geq kx \geq x) \).

Each hedge \( h \in H \) can be regarded as a unary function \( h: X \rightarrow X; x \mapsto hx \). Moreover, suppose that each hedge is an ordering operation, i.e., \( \forall h \in H, \forall x \in X; hx > x \text{ or } hx < x \).

Let \( I \in H \) be the identity hedge, i.e., \( Ix = x \) for all \( x \in X \). Let us define some properties of hedges in the following definition.

Definition 1 A hedge chain \( \sigma \) is a word over \( H, \sigma \in H^* \). In the hedge chain \( h_\sigma \ldots h_1 \), \( h_1 \) is called the first hedge whereas \( h_\sigma \) is called the last one. Given two hedges \( h, k \), we say that:

i) \( h \) and \( k \) are converse if \( \forall x \in X; hx > x \text{ if and only if } kx < x \);
ii) \( h \) and \( k \) are compatible if \( \forall x \in X; hx > x \text{ if } kx > x \);
iii) \( h \) modifies terms stronger or equal than \( k \), denoted by \( h \geq k \), if \( \forall x \in X; (hx > kx \leq x) \text{ or } (hx \geq kx \geq x) \).

iv) $h$ is positive w.r.t. $k$ if $\forall x \in X: (hkx < kx < x)$ or $(hkx < kx > x)$.

v) $h$ is negative w.r.t. $k$ if $\forall x \in X: (kx < hkx < x)$ or $(kx < hkx > x)$.

The most commonly used HA are symmetric ones, in which there are exactly two generators, like e.g., $G = \{ \text{True}, \text{False} \}$. In this paper, we only consider symmetric HA. Let $G = \{ c^+, c^- \}$, where $c^+ > c^-; c^+$ and $c^-$ are called positive and negative generators, respectively. The set $H$ is decomposed into the subsets $H^+ = \{ h \in H | hc^+ > c^+ \}$ and $H^- = \{ h \in H | hc^- < c^- \}$. For each value $x \in X$, let $H(x) = \{ \sigma x | \sigma \in H \}$. 

**Definition 2** An abstract algebra $(X, G, H, >)$, where $X \neq \emptyset$, $G = \{ c^+, c^- \}$ and $X = \{ \sigma c \sigma \in G, \sigma \in H \}$, is called a linear symmetric HA if it satisfies the following conditions:

(A1) For all $h \in H^+$ and $k \in H^-$, $h$ and $k$ are converse.

(A2) The sets $H^+ \cup \{ I \}$ and $H^- \cup \{ I \}$ are linearly ordered with the least element $I$.

(A3) For each pair $h, k \in H$, either $h$ is positive or negative wrt $k$.

(A4) If $h \neq k$ and $hx < kx$ then $h'x < k'x$, for all $h, k, h', k' \in H$ and $x \in X$.

(A5) If $u \neq H(v)$ and $u < v (u > v)$ then $u < hv (u > hv$, resp.), for any $h \in H$.

**Example 1** Consider a HA $(X, \{ \text{True}, \text{False} \}, H, >)$. We have $H^+ = \{ \text{Very}, \text{More}, \text{Probably}, \text{Mol} \}$, and (i) Very and More are positive wrt Very and More, negative wrt Probably and Mol; (ii) Probably and Mol are negative wrt Very and More, positive wrt Probably and Mol.

$H$ is decomposed into $H^+ = \{ \text{Very}, \text{More} \}$ and $H^- = \{ \text{Probably}, \text{Mol} \}$. All generator $H^+ \cup \{ I \}$ have $\text{Very} > \text{More} > I$, whereas in $H^- \cup \{ I \}$ we have $\text{Mol} > \text{Probably} > I$.

**Definition 3 (Mono-HA)** A HA $(X, G; H; >)$ is called monotonic if each $h \in H^+(H^-)$ is positive wrt all $k \in H^+(H^-)$, and negative wrt all $h \in H^-(H^+)$. As defined, both sets $H^+ \cup \{ I \}$ and $H^- \cup \{ I \}$ are linearly ordered. However, $H \cup \{ I \}$ is not, e.g., in Example 1 $\text{Very} \in H^+$ and $\text{Mol} \in H$ are not comparable. Let us extend the order relation on $H^+ \cup \{ I \}$ and $H^- \cup \{ I \}$ to one on $H \cup \{ I \}$ as follows.

**Definition 4** Given $h, k \in H \cup \{ I \}$, $h \geq_k k$ if:

i) $h \in H^+, k \in H^-; or$

ii) $h, k \in H^+ \cup \{ I \}$ and $h \geq k; or$

iii) $h, k \in H^- \cup \{ I \}$ and $h \leq k. h >_k k$ iff $h \geq_k k$ and $h \neq k$.

**Example 2** The HA in Example 1 is Mono-HA. The order relation $>_h \cap H \cup \{ I \}$ is $\text{Very} > _h \text{More} > _h I >_h \text{Mol}.$

Then, in Mono-HA, hedges are "context-free", i.e., a hedge modifies the meaning of a linguistic value independently of preceding hedges in the hedge chain.

### 2.2 Inverse mapping of hedge

In application of hedge algebra into direct reasoning on natural language [4], using hedge moving rule RT1 and RT2:

**RT1** $(p(x; hu), \delta c) \xrightarrow{\phi(x; u), \delta h} (p(x; u), \delta h c)$

**RT2** $(p(x; u), \delta h c) \xrightarrow{\phi(x; hu), \delta c} (p(x; hu), \delta c)$

**Example 3** Applying rule of hedge moving, there are two equal statements: "It is true that Robert is very old" and "It is very true that Robert is old". It means that if the reliability of the sentence: "Robert is very old" is "True", the reliability of the sentence: "Robert is old" is "Very True" and vice versa.

However the above hedge moving rules are not applied in such case as from the true value of the sentence: "John is young" is "Very True", we can not count the true value of the sentence: "John is more young". To overcome the above weak point, in [5-7] inverse mapping of hedge is proposed.

**Definition 5** Given $H = (X, \{ c^+, c^- \}, H, \leq)$ and hedge $h \in H$. We take $AX = \{ 0, W, 1 \}$ of which 0, 1 are the smallest, neutral, and biggest element in $AX$ respectively. A mapping $h^* : AX \rightarrow AX$ is called inverse mapping of $h$ if it meets the following conditions:

i) $h^*(\delta c) = \delta c$ of which $\delta \in G = \{ c^+, c^- \}$, $\delta \in H^*$

ii) $x \leq y \Rightarrow h^*(x) \leq h^*(y)$ of which $x, y \in X$

In case of inverse mapping of a hedge string, we determine it, based on inverse mapping of single hedges as follows:

$$(h_k h_{k-1} \ldots h_1)^*(\delta c) = h_k^* \ldots h_1^* (\delta c)$$

Then the rule (RT2) is generalized as follows:

$$\frac{(p(x; u), \delta c)}{\phi(x; hu), \delta c}$$

In [5-8], it is shown that inverse mapping of hedge always exists and inverse mapping value of hedge is not unique.

### 3. Linguistic many-valued logic

#### 3.1 Linguistic truth valued domain

In real life, people only use a string of hedge with finite length for a vague concept in order to have new vague concepts and only use a finite string of hedges for truth values. This makes us think about limiting the length of the hedge string in the truth value domain to make it not exceed $L \geq 0$ any positive number. In case that intellectual base has a value having length of hedge string bigger than $L$, we need to approximate the value having hedge string $\leq L$. Based on monotonous hedge algebra Mono – HA, we set finite monotonous hedge algebra to make linguistic truth value domain.

**Definition 7** $(L \rightarrow Mono – HA) L \rightarrow Mono – HA, L$ is a natural number, is a Mono – HA with standard presentation of all elements having the length not exceed $L + 1$.

**Definition 8** (Linguistic truth value domain) A linguistic truth value domain $AX$ taken from a $L \rightarrow Mono – HA = (X, \{ c^+, c^- \}, H, \leq)$ is defined as $AX = \{ 0, W, 1 \}$ of which 0, 1 are the smallest, neutral, and biggest elements respectively in $AX$.

**Example 4** Given finite monotonous hedge algebra $2 \rightarrow Mono – HA = (X, \{ c^+, c^- \}, \{ V, M, P \}, \leq) (\forall \in \{ V, M, P \}, M \geq_0 \text{More} >_h \text{Probabily} >_h \text{Mol}.$

We have the linguistic truth value domain $AX = \{ 0, Vc, Mc, M, Vc, \{ V, M, P \}, \leq) (\forall \in \{ V, M, P \}, M \geq_0 \text{More} >_h \text{Probabily} >_h \text{Mol}.$

**Example 4** Given finite monotonous hedge algebra $2 \rightarrow Mono – HA = (X, \{ c^+, c^- \}, \{ V, M, P \}, \leq) (\forall \in \{ V, M, P \}, M \geq_0 \text{More} >_h \text{Probabily} >_h \text{Mol}.$
Propositions 1 If we have \( L - Mono - HA = (X, [c^+, c^-, c], H, \leq) \), the linguistic truth value domain \( AX \) is finite to number of elements \( |AX| = 3 + 2 \sum_{i=0}^{b} |H|^i \) and elements of \( AX \) is linearly ordered. (The symbol \( |AX| \) is the number of elements of \( AX \) and \( |H| \) is the number of \( H \) hedges).

Proof Suppose that \( |H| = n \), we have always 3 elements 0,1,\( W \);

With \( i=0 \), we have 2 more elements\( (c^+, c^-) \); \( i=1 \), we have 2\( n^1 \) more elements; ... with \( i=L \) we have 2\( n^L \) more elements.

Then \( |AX| = 3 + 2(1 + n + \cdots + n^L) = 3 + 2 \sum_{i=0}^{L} |H|^i \)

According to the definition of linear order relation in monotonic hedge algebra \( Mono - HA \), we see that, elements in \( AX \) are linearly ordered. ■

Example 5 According to Example 4, we have the language true value domain (is linearly ordered) \( AX = \{ v_1 = 0, v_2 = VVC_-, v_3 = VVc_-, v_4 = Vc_-, v_5 = PCc_-, v_6 = PCc_-, v_7 = Mc_-, v_8 = Mcc_-, v_9 = Mcc_-, v_{10} = Pmc_-, v_{11} = Vc_-, v_{12} = Cc_-, v_{13} = PCc_-, v_{14} = Vc_-, v_{15} = W_-, v_{16} = Wc_+, v_{17} = Mc_+, v_{18} = Mcc_+, v_{19} = Vc_+, v_{20} = Cc_+, v_{21} = Pmc_+, v_{22} = PMc_+, v_{23} = Vc_+, v_{24} = Cc_+, v_{25} = Pmc_+, v_{26} = PMc_+, v_{27} = Mcc_+, v_{28} = Mcc_+, v_{29} = 1 \} \).

We can determine the index of \( v \) by Algorithm 1:

Algorithm 1 (Finding index)

Input: Domain (Truth) of \( L - mono - HA \) is \( AX \),

\[ H^- = \{ h_{-q_1}, \ldots, h_{-1} \}, \quad H^+ = \{ h_1, \ldots, h_L \} \]

\( x = l_1 \ldots l_c \) with \( c \in \{T,F \} \), \( k \leq L \)

Output: Finding index so that \( v_{index} = x \)

Methods:

\[ M = 3 + 2 \sum_{i=0}^{L} (p+q)^i \]

if \( x=0 \) then index=1;

if \( x=W \) then index=(\( M+1 \))/2;

if \( x=1 \) then index=M;

index = \( (M+1)/2 + 1 + qAX^1 \)

for \( i=1 \) to \( k-1 \) do

\{ find \( j \) such that \( l_i = h_j \)

\[ \text{if } j>0 \text{ then index} = \text{index} + (j-1)|AX^i| + |AX^{i+1}| + 1; \]

\[ \text{if } j<0 \text{ then index} = \text{index} - (|j|-1)|AX^i| - p|AX^{i+1}| - 1; \]

\}

find \( j \) such that \( l_k = h_j \) \( / \) \( * j > 0 \) then \( l_k \in H^- \), else \( l_k \in H^+ \) \( / \)

if \( k<=L \) then

\{ if \( j>0 \) then index = index + (j-1)|AX^k| + |AX^{k+1}| + 1;

\[ \text{if } j<0 \text{ then index} = \text{index} - (|j|-1)|AX^k| - p|AX^{k+1}| - 1; \]

\}

Else index=index+j;

if \( c=False \) then index = (\( M+1 \) - index)

return (index)

\[ \ast |AX^i| = \sum_{k=0}^{\infty} (p+q)^k \]

Based on the algorithm to identify the inverse map of hedge and properties studied in [8], we can establish the inverse map for \( 2 - Mono - HA = (X, [c^+, c^-], \{ V, M, P \}, \leq) \) with a note that, if \( h^-(x) = W \) with \( x \in H(c^+) \) we can consider \( h^-(x) = VPC^+ \) the smallest value of \( H(c^+) \); if \( h^-(x) = 1 \) with \( x \in H(c^-) \) we can consider \( h^-(x) = VPC^- \) the biggest value of \( H(c^-) \); if \( h^-(x) = 0 \) with \( x \in H(c^-) \) we can consider \( h^-(x) = VVC^- \) the smallest value of \( H(c^-) \). The following is an example on inverse map of \( 2 - Mono - HA = (X, [c^+, c^-], \{ V, M, P \}, \leq) \):

\[ (k \in H) \quad ( \leq ) \]

3.2 Linguistic many-valued logic

Many-valued logic is a generalization of Boolean logic. It provides truth values that are intermediate between True and False. We denote by \( N \) the number of truth degrees in many-valued logic.

The linguistic truth value domain \( AX = \{ v_i | i = 1,2, \ldots, n \} \) with \( v_1 = 0 \) and \( v_n = 1 \) in finite monotonous hedge algebra and linear order or \( AX = \{ v_i | i = 1,2, \ldots, n \}; \quad v_1 = 0, v_n = 1 \) and \( \forall 1 \leq i, j \leq n: v_i \geq v_j \iff i \geq j \).

In linguistic many-valued logic, the truth degree of proposition is \( v_i \in AX \).

T-norms, T-conorms, implicators and negation operator are used as in Fuzzy logic. In many-valued logic, the aggregation functions of lukasiewicz are often used. In this context and with \( N \) truth degrees, they are defined by [9-11]:

\[ T_i(v_i, v_j) = v_{\max(i,j)-N} \]
\[ S_i(v_i, v_j) = v_{\min(N, i+j-1)} \]
\[ I_i(v_i, v_j) = v_{\min(N, N-i+j)} \]

\[ N(v_i) = v_{N-i+i} \]
\[ v_i \land v_j = v_{\min(i,j)} \]
\[ v_i \lor v_j = v_{\max(i,j)} \]
We can use T-norms, T-conorm, implicators, Λ, V and negation operator above in linguistic many-valued logic with $v_i, v_j \in AX$.

4. Generalized If...Then...Else inference rules with linguistic modifiers

4.1 Generalized If...Then...Else rules

One vague sentence can be represented by $p(x,u)$, wherein $x$ is a variable, $u$ is a vague sentence. In general, by an assertion is one pair $A=p(x,u), \delta C$ (Symbol: $(P,v)$), wherein $p(x,u)$ is a vague sentence, $\delta C$ is a linguistic truth value. One knowledge base $K$ is a finite set of assertions. From the given knowledge base $K$, we can deduce new assertions by using on derived rules. In [4,5,6], the hedge moving rules are set:

RT1: \[ \frac{(p(x,hu), \delta C)}{(p(x;u), \delta C)} \]
GRT2: \[ \frac{(p(x;u), \delta C)}{(p(x,hu), \delta C)} \]

And

\[ (p(x,NOT(u)), \delta C) \leftrightarrow \exists (p(x, u), NOT(\delta C)) \] (RN)
\[ (p(x, NOT(\delta u)), \delta C) \leftrightarrow \exists (p(x, \delta NOT(u))) \] (RNH)

(with $\delta$ is the hedge string).

In [9,10], the generalized modus ponens was proposed

GMP:
\[ \frac{(p(x;u), (q(y,v),v_j),(p(x;u),v_j))}{q(y,v)} \]

EGMP:
\[ \frac{(p(x;u),v_j) \rightarrow (q(y,v);v_j),(p(x;u);v_k)}{q(y,v),T_{L}(I_{L}(v_i;v_j),v_k)} \]

Herein, EGMP is an extension of GMP.

From GMP, EGMP and RN, we have:

NGMP:
\[ \frac{(p(x, NOT(u)), \delta C) \rightarrow (q(y,v),v_j),(p(x;u),v_j))}{q(y,v),T_{L}(I_{L}(v_i;v_j),v_k)} \]

NEGMP:
\[ \frac{(p(x;u),v_j) \rightarrow (q(y,v),v_j),(p(x;u);v_k)}{q(y,v),T_{L}(I_{L}(v_i;v_j),v_k)} \]

Let us consider the fuzzy inference in which the fuzzy conditional “If...Then...Else” is contained:

(ITE):
Antecedent 1: \[ If \ X \ is \ NOT \ A \ then \ Y \ is \ C \]
Antecedent 2: \[ X \ is \ A' \]
Conclusion:
\[ Y = D \]

According to [12,13], “If-Then-Else” inferences rules may be a quite natural demand:

Antecedent 1: \[ If \ X \ is \ A \ then \ Y \ is \ B \ else \ Y \ is \ C \]
Antecedent 2: \[ X \ is \ A \]
Conclusion:
\[ Y = B \]

Antecedent 1: \[ If \ X \ is \ A \ then \ Y \ is \ B \ else \ Y \ is \ C \]
Antecedent 1: \[ X \ is \ NOT \ A \]
Conclusion:
\[ Y = C \]

When, “If-Then-Else” inference rules can be divided under two subschemes, that is:

(IT1):
Antecedent 1: \[ If \ X \ is \ A \ then \ Y \ is \ B \]
Antecedent 2: \[ X \ is \ A' \]
Conclusion:
\[ Y = B' \]

(ITE):
Antecedent 1: \[ If \ X \ is \ NOT \ A \ then \ Y \ is \ C \]
Antecedent 2: \[ X \ is \ A' \]
Conclusion:
\[ Y = D' \]

(II):
Antecedent 1: \[ If \ X \ is \ A \ then \ Y \ is \ B \]
Antecedent 1: \[ X \ is \ NOT \ A \]
Conclusion:
\[ Y = C' \]

According to [12,13], the conclusion “Y is D’” in the “If...Then...Else” inference scheme, should be “Y is B’” and “Y is C’”, that mean:

\[ If \ X \ is \ A \ then \ Y \ is \ B \ then \ Y \ is \ C \Leftrightarrow If \ X \ is \ A \ then \ Y \ is \ B \]
\[ If \ X \ is \ NOT \ A \ then \ Y \ is \ C \]

Therefore, the conclusion D in (ITE) is computed by aggregation Min of B’ in (IT1) and C’ in (IT2).

We can generalized (IT1) and (IT2) with linguistic modifiers following:

Given $\alpha, \beta, \delta, \theta, \vartheta, \alpha', \beta', \theta', \vartheta'$ is the hedge strings. Get $\alpha = h_1 h_2 \ldots h_k$, symbol $\alpha^{-1} = h_k h_{k-1} \ldots h_1$. We have following propositions (Generalized If-Then-Else inference rules with linguistic modifiers):

**Proposition 2**
\[ (p(x; \delta u), \alpha' c') \rightarrow (q(y; \vartheta v), \beta c') \]
\[ (p(x; \delta u), \alpha c') \rightarrow (q(y; \vartheta v), \beta c') \]

**Proof**
According to RT1 we have: $\langle p(x; u), \alpha' \delta^{-1} c' \rangle$.
Then, applying GRT2 we have:
\[ (p(x; \delta u), \delta (\alpha' \delta^{-1} c')) \]

Finally, using GMP we have:
\[ (q(y; \vartheta v), T_{L}(\alpha, \delta^{-1} (\alpha' \delta^{-1} c'))) \]

**Proposition 3**
\[ (p(x; \delta u), \alpha c) \rightarrow (q(y; \vartheta v), \beta c) \]
\[ (p(x; \delta u), \alpha' c') \rightarrow (q(y; \vartheta v), \beta c) \]

**Proof**
Applying RT1 we have:
\[ (p(x; u), \alpha \delta^{-1} c') \]
Then, using NGMP we have:
\[ (q(y; \vartheta v), T_{L}(\alpha \delta^{-1} c, \beta \delta^{-1} c'), c' \delta^{-1} c')) \]

Finally, using GRT2 we have:
\[ (q(y; \vartheta v), \delta^{-1} (T_{L}(\alpha \delta^{-1} c, \beta \delta^{-1} c'), c' \delta^{-1} c')) \]

**Proposition 4**
\[ (p(x; \delta u), \alpha c) \rightarrow (q(y; \vartheta v), \beta c) \]
\[ (p(x; \delta u), \alpha' c') \rightarrow (q(y; \vartheta v), \beta c) \]

**Proof**
According to RT1 we have:
\[ (p(x; u), \alpha' \delta^{-1} c') \]
Then, applying GRT2 we have:
\[ (p(x; \delta u), \delta (\alpha' \delta^{-1} c')) \]

Finally, using NGMP we have:
\[ (q(y; \vartheta v), T_{L}(\alpha \delta^{-1} c, \beta \delta^{-1} c'), N (\alpha' \delta^{-1} c')) \]

**Proposition 5**
\[ (p(x; \delta u), \alpha c) \rightarrow (q(y; \vartheta v), \beta c) \]
\[ (p(x; \delta u), \alpha' c') \rightarrow (q(y; \vartheta v), \beta c) \]

**Proof**
Applying RNH we have:
\[ p(x; NOT(\delta u)) \Leftrightarrow p(x; \delta (NOT(u))) \]
Applying RT1 we have:
\[ (p(x; NOT(u)), \alpha^{-1} \delta c) \]
(q(y; v), \beta \delta^{-1}c); (p(x; u), \alpha \delta^{-1}c); \\
Then, using NEGMP we have:
(q(y; v), T_L(I_1(\alpha \delta^{-1}c, \beta \delta^{-1}c), N(\alpha \delta^{-1}c))); \\
Finally, using GRT2 we have:
(q(y; \delta'v), \delta''(T_L(I_1(\alpha \delta^{-1}c, \beta \delta^{-1}c), N(\alpha \delta^{-1}c)))).

4.2 Deductive procedure based on generalized
“If…Then…Else” inference rules

The deduction method is derived from knowledge base K
using the above rules to deduce the conclusion (P, v), we can write K \vdash (P, v). Let C(K) denote the set of all possible
conclusions: C(K) = \{(P, v); K \vdash (P, v)\}. A knowledge
base K is called consistent if, from K, we can not deduce
two assertions (P, v) and (\neg P, v).

Here, we build an deduction procedure (Algorithm 2)
with hedge moving rules and Proposition (2-5) for
solving approximate reasoning.

**Problem** Suppose that we have a given knowledge base K.
By deduction rules, how can we deduce conclusions from K?

**Algorithm 2** (Deductive procedure)

**Input:** Knowledge base set K; L – Mono – HA
**Output:** Truth value of the clause (P, v)
**Method:**

1. Using the moving rules RT1 and
calculate the dim
unknown claims in the knowledge
base. In the case of the
linguistic truth value of the
new clause does not belong to
AX, or the hedge series length
is greater than L, we must
approximate the hedge series to
hedge series of length L by
removing the outside left hedge.
(The outside left hedge of hedge
series make little change to the
semantics of linguistic truth
value);

2. Finding the truth value
expression of the conclusion
using Proposition (2-5);

3. Transferring the truth value \delta c
in the expression found in Step
2 into v_i; v_i = \delta c (Algorithm 1)

4. Calculating the truth value
expression based on T-norms,
T-conorm, implicators, negate and
\land (Min) operation was defined
above an application inverse of
hedge;

5. Making the truth value of
conclusion clause.

4.3 Examples

**Example 6** Given the following knowledge base:

i) If a student studying more hard
Then he will be a good
employee is possibly very true
Else he will be a good
employee is possibly very false

ii) Mary is studying very hard is more true.
Find the truth value of the sentence: “Mary will be a good
employee”

We can be divided into two subschemes:

(1): i) If a student studying more hard
Then he will be a
good employee is possibly very true.

(2): ii) Mary is studying very hard is more true.

Example 7 Given the following knowledge base:

i) If a student studying more hard
Then he will be a good
employee is possibly very true
Else he will be a good
employee is possibly very false

ii) Mary is studying very hard is more true.
Find the truth value of the sentence: “Mary will be a good employee”

(IT1):
1. If a student studying more hard is possibly true Then he will be a good employee is possibly very true
2. Mary is studying very hard is more true.

(IT2):
1. If a student studying NOT(more hard) is possibly true Then he will be a good employee is possibly very false
2. Mary is studying very hard is more true.

By formalizing, (i) – (iii) an be rewritten by follow:
1. (studying(x;MHard), PTrue) → emp(x;good), PVTrue)) (Base on the hypothesis(i))
2. (studying(Mary; VHard), MTrue) (Base on (ii))

Based on the knowledge base (i-ii) and Proposition 3, we have following result:
(emp(x;good);T_i(I_{\text{IL}}(PMT\text{True}, PV\text{True}, MVT\text{true})))

We have calculations: (Under Example 5, Table 1 and T-norms, T-conorm and implicators defined in Part 3)
PMT\text{True} = v_{21}; PV\text{True} = v_{25}; MVT\text{true} = v_{27}
I_L(PMT\text{True}, PV\text{True}) = I_L(v_{21}, v_{25}) = v_{29}
T_i(v_{29}, v_{27}) = v_{27}

(IT2)
By formalizing. (i) – (iii) an be rewritten by follow:
1. (studying(x;NOT(MHard)), PV\text{True}) → emp(x;good), PV\text{True})

2. (studying(Mary; VHard), M\text{True}) (Base on the hypothesis(i))

Based on the knowledge base (i-ii) and Proposition 5, we have following result:
(emp(x;good);T_i(I_{\text{IL}}(PMT\text{True}, PV\text{True}, MVT\text{true})))

We have calculations: (Under Example 5, Table 1 and T-norms, T-conorm and implicators defined in Part 3)
PMT\text{True} = v_{21}; PV\text{True} = v_{25}; N(MVT\text{true}) = N(v_{27}) = v_{3}
I_L(PMT\text{True}, PV\text{True}) = I_L(v_{21}, v_{25}) = v_{29}
T_i(v_{29}, v_{3}) = v_{3}

According to (IT1) and (IT2), we have the truth value of the sentence “Mary will be a good employee” is (emp(Mary; good), v_{27} \land v_{3} = v_{3} = MVF\text{False}), which means Mary will be a good employee is More Very False.

5. Conclusion
With the studies on finite monotonous hedge algebra as the linguistic truth value domain, the linguistic truth value domain is finite and the linear order organized elements can act as base value set for truth domain of logic system. In this paper, we studied generalized If...Then...Else inference rules with linguistic modifiers and building an deduction procedure and use it to solve the language deduction problem. In furture works, we would be to study an inference formalization for more complex rules.
